

Crypto Trading, Taught Like It Matters.

A 51-lesson interactive course that takes a complete beginner from "what is a futures contract?" to a working personal trading system — with visual diagrams, scored quizzes, and a tone that respects your time.

Trading Training

Path

Crypto Trading — Beginner to Pro

51 graded units across 6 tiers. Pass each tier's lessons to unlock the next.

0 of 45 lessons passed

[Reset all progress](#)

 **Testing mode** — all lessons unlocked regardless of quiz progress. Set `unlock_mode: enforce` in `training/config.yaml` to require quiz passing.

Tier 1 — Foundations

0/11

☐ Spot vs Futures vs Perpetuals ~8 min · 1	☐ Picking a broker ~8 min · 2	☐ Order types: Market / Limit / Stop / Stop-Limit / OCO ~8 min · 3
☐ Long vs Short — what shorting really is ~8 min · 4	☐ Fees, funding rates, slippage ~8 min · 5	☐ Risk per trade — the 1-2% rule ~8 min · 6
☐ Position sizing — SL distance + risk % → contract count ~8 min · 7	☐ Leverage 1x vs 5x vs 100x — isolated vs cross ~8 min · 8	☐ Trading psychology basics: FOMO, revenge, tilt ~8 min · 9
☐ Paper → small-size → full-size progression	☐ Tier 1 Final Tier final · 12 questions

TIERS ·
BEGINNER → PRO

Structure: from survival math to professional discipline.

Each tier builds on the previous. You can't pass Tier 3 (Indicators) without first mastering Tier 2 (Chart Reading) — because indicators on top of chart-reading *blindness* just adds noise, not signal. The unlock chain isn't a gimmick; it mirrors how actual trader competence develops.

1	Foundations Spot vs perp, leverage, position sizing, risk %, psychology — the survival math that prevents account-killing mistakes.	11 units
2	Chart Reading Candle anatomy, reversal patterns, support & resistance, trendlines, market structure, multi-timeframe analysis.	10 units
3	Indicators RSI (regime-aware), MACD, Bollinger Bands, volume, ADX, Stochastic, Fibonacci, ATR-based stops — used right, not as black boxes.	9 units
4	Advanced Order flow / CVD, liquidation maps, Wyckoff phases, Spring & Upthrust, Order Blocks, FVGs, SMC (with honest commentary on what's marketing).	9 units
5	Macro & Context DXY, VIX, S&P futures, BTC dominance, Fear & Greed, news events, correlation regimes — crypto doesn't trade in a vacuum.	6 units
6	Execution & Journaling + Capstone Pre-trade Apgar scorecard, pre-session readiness, journaling, weekly review, building your own system. Full multi-TF walkthroughs.	6 units

Every lesson includes:

- ✓ 5-10 minute trader-to-trader read
- ✓ Visual diagrams where they help (24 across the course)
- ✓ Comparison tables for trade-offs
- ✓ Worked examples with real numbers
- ✓ Common-mistakes callouts
- ✓ 10-question quiz with explanations on wrong answers

Lesson 12 — candle anatomy with labeled diagram

You don't pass by reading. You pass by understanding.

Quizzes are the gate. 10 multiple-choice questions per lesson, written to test concept understanding — not memorization of trivia. Pass at 8/10 to unlock the next lesson. Tier finals raise the bar (10/12). The capstone exam is 25 questions pulled from across the curriculum.

Quiz interface — instant feedback, explanations on every wrong answer

How learning actually sticks:

- ✓ **Forced articulation** — multiple choice forces you to commit to a specific interpretation
- ✓ **Explanations on miss** — every wrong answer shows you why, with reference to the lesson concept
- ✓ **Tier finals at 10/12** — higher bar than per-lesson 8/10 because Tier-level concepts are load-bearing
- ✓ **Retry without time penalty** — review the explanations, take it again, learn the gap
- ✓ **Progress saved server-side** — pick up where you left off on any device
- ✓ **One-click reset** — wipe progress for a fresh start or to hand off to a friend

CONFIGURABLE FOR ANY AUDIENCE

Strict mode (`unlock_mode: enforce`): the production flow — lessons unlock only after the previous quiz is passed. The intended sequential learner experience.

Open mode (`unlock_mode: open`): all lessons clickable regardless of progress. Useful for review-mode, content authoring, or just letting a curious visitor browse freely. Progress badges still show real state. One-line change in `training/config.yaml` ; no restart needed.

Tier 4 — Wyckoff cycle visualization

Trade Apgar — 5-Dimension Pre-Trade Scorecard			
Setup Quality	Pre-planned A-setup? Or impulse?	100%	100%
Risk-Reward	≥ 1:2? Ideally 1:3+?	100%	100%
Confluences	4+ signals aligned? Or just 1?	100%	100%
Macro/Regime	Aligned with HTF + macro?	100%	100%
Personal State	Calm, rested, focused?	100%	100%
PASS: total ≥ 7 AND no zeros in any dimension → TRADE. Otherwise SKIP.			
Five dimensions, scored 0-2 each, max 10. Pass: total ≥ 7 AND no zeros in any dimension.			
Dimension	Question	Scoring	
1. Setup quality	Does this setup match my pre-defined criteria? Did I plan it or is it impulse?	2 = pre-planned A-setup, 1 = pre-planned B-setup, 0 = impulse trade not on plan.	
2. R/R	Is the risk/reward at least 1:2? Ideally 1:3+?	2 = R/R ≥ 1:3, 1 = R/R 1:2 to 1:3, 0 = R/R < 1:2.	
3. Confluences	How many independent signals support this trade? (SR + candle + volume + indicator + multi-TF alignment + macro etc.)	2 = 4+ confluences, 1 = 2-3 confluences, 0 = 0-1 confluences.	
4. Macro/Regime	Is this trade aligned with macro and HTF?	2 = fully aligned (macro + HTF + setup)	

Tier 6 — Trade Apgar pre-trade scorecard

Stand-alone. Two dependencies. Five-line install.

The training module is a self-contained Flask package. It mounts inside our full trading journal at `/training`, OR runs on its own Pi/laptop/server as an independent app. Zero shared state with the parent project.

```
# On a fresh machine (Raspberry Pi, Ubuntu, Mac, anything with Python 3.10+): git
clone https://github.com/anvilfilbert/Auto-Crypto-Tradingjournal.git cd Auto-Crypto-
Tradingjournal # ← parent of training/ pip3 install -r training/requirements.txt #
flask + pyyaml, ~10s python3 -m training --port 5050 # http://your-pi:5050/
```

Architecture for collaborators:

- ✓ **Zero imports from the parent journal** — verifiable by grep
- ✓ **Own SQLite** (`training.db`), separate from journal data
- ✓ **CSS scoped under** `.training-*` — no global pollution if embedded elsewhere
- ✓ **JS in its own module** — no shared globals
- ✓ **No external API calls**, no env vars, no credentials, no telemetry
- ✓ **Idempotent diagram generator** + wiring script — add new visuals in minutes
- ✓ **2 MB tarball** — copy the folder anywhere and it works

Easy to extend:

- ✓ **Lesson content** in plain JSON — markdown-like blocks
- ✓ **Quizzes** in plain YAML — questions, answers, explanations
- ✓ **Diagrams** generated by matplotlib script (one function = one diagram)
- ✓ **Catalog** is one JSON file — add a lesson, append an entry
- ✓ **Two reusable scripts:**
 - `generate_chart_diagrams.py` + `insert_diagrams_into_lessons.py` handle the boilerplate

FORK-FRIENDLY BY DESIGN

We built this to be the curriculum BASE for whoever wants to teach trading their way. Fork it. Rewrite Tier 4 with your own SMC takes. Add a Tier 7 on options. Swap the dark theme. Translate every lesson. Embed inside your community's Discord bot via the JSON API. The coupling rules and content/code separation make all of this easy.

Want to see it live? Spin it up in 5 minutes.

Tested on Raspberry Pi 5 (Bookworm), Ubuntu 24, macOS Sonoma. Python 3.10+ and a free port is all you need.
